Ouestion 1 Marked out of 5.00 Flag question

Write a function that takes an input String (sentence) and generates a new String (modified sentence) by reversing the words in the original String, maintaining the words position.

In addition, the function should be able to control the reversing of the case (upper or lowercase) based on a case_option parameter, as follows:

If case_option = 0, normal reversal of words i.e., if the original sentence is "Wipro TechNologies BangaLore", the new reversed sentence should be "orpiW seigoloNhceT eroLagnaB".

If case_option = 1, reversal of words with retaining position's case i.e., if the original sentence is "Wipro TechNologies BangaLore", the new reversed sentence should be "Orpiw SeigOlonhcet ErolaGnab".

Note that positions 1, 7, 11, 20 and 25 in the original string are uppercase W, T, N, B and L.

Similarly, positions 1, 7, 11, 20 and 25 in the new string are uppercase O, S, O, E and G.

NOTE:

- 1. Only space character should be treated as the word separator i.e., "Hello World" should be treated as two separate words, "Hello" and "World". However, "Hello, World", "Hello; World", "Hello-World" or "Hello/World" should be considered as a single word.
- 2. Non-alphabetic characters in the String should not be subjected to case changes. For example, if case option = 1 and the original sentence is "Wipro TechNologies, Bangalore" the new reversed sentence should be "Orpiw ,seiGolonhceT Erolagnab". Note that comma has been treated as part of the word "Technologies," and when comma had to take the position of uppercase T it remained as a comma and uppercase T took the position of comma. However, the words "Wipro and Bangalore" have changed to "Orpiw" and "Erolagnab".
- 3. Kindly ensure that no extra (additional) space characters are embedded within the resultant reversed String. Examples:

S. No.	input1	input2	output
1	Wipro Technologies Bangalore	0	orpiW seigolonhceT erolagnaB
2	Wipro Technologies, Bangalore	0	orpiW ,seigolonhceT erolagnaB
3	Wipro Technologies Bangalore	1	Orpiw Seigolonhcet Erolagnab
4	Wipro Technologies, Bangalore	1	Orpiw ,seigolonhceT Erolagnab

For example:

Input	Result
Wipro Technologies Bangalore 0	orpiW seigolonhceT erolagnaB
Wipro Technologies, Bangalore 0	orpiW ,seigolonhceT erolagnaB
Wipro Technologies Bangalore	Orpiw Seigolonhcet Erolagnab
Wipro Technologies, Bangalore 1	Orpiw ,seigolonhceT Erolagnab

Answer: (penalty regime: 0 %)

```
1 | import java.util.Scanner;
    public class ReverseWordsWithCaseControl {
         \ensuremath{//} Function to reverse words and control case
         public static String reverseWordsWithCaseControl(String sentence, int caseOption) {
             // Split the sentence into words using space as the delimiter
String[] words = sentence.split(" ");
 8
 9
             StringBuilder result = new StringBuilder();
10
11
             // \  \, \text{Iterate through each word}
12
             for (String word : words) {
13
                  // Reverse each word
                 String reversedWord = new StringBuilder(word).reverse().toString();
14
15
16
                  if (caseOption == 1) {
                       // Case reversal with position maintenance (ignoring non-alphabetic charac
17
                      StringBuilder caseReversedWord = new StringBuilder():
18
19
                      for (int i = 0; i < word.length(); i++) {</pre>
20
                          char originalChar = word.charAt(i);
21
```

```
22
                       char reversedChar = reversedWord.charAt(i);
23
                       // If the character is alphabetic, apply case transformation
24
25
                       if (Character.isAlphabetic(originalChar)) {
                           if (Character.isUpperCase(originalChar)) {
26
                              caseReversedWord.append(Character.toUpperCase(reversedChar));
27
                                                            caseReversedWord.append(Charac
28
                           } else {

Question ${\bf 2}$

Marked out of

5.00

Flag question

Given two char arrays input1[] and input2[] containing only lower case alphabets, extracts the alphabets which are present in both arrays (common alphabets).

Get the ASCII values of all the extracted alphabets.

Calculate sum of those ASCII values. Lets call it sum1 and calculate single digit sum of sum1, i.e., keep adding the digits of sum1 until you arrive at a single digit.

Return that single digit as output.

Note:

- 1. Array size ranges from 1 to 10.
- All the array elements are lower case alphabets.
- Atleast one common alphabet will be found in the arrays. 3.

Example 1:

```
input1: {'a', 'b', 'c'}
```

input2: {'b', 'c'}

output: 8

Explanation:

'b' and 'c' are present in both the arrays.

ASCII value of 'b' is 98 and 'c' is 99.

```
98 + 99 = 197
```

1 + 9 + 7 = 17

1 + 7 = 8

For example:

Input	Result
abc bc	8

Answer: (penalty regime: 0 %)

```
1 - public class CommonCharsAsciiSum{
2 v
      public static int calculatesingledigitsum(char[] input1,char[] input2){
```

```
StringBuilder commonChars=new StringBuilder();
 4
             for(char c1:input1){
 5
                 for(char c2:input2){
 6
                     if(c1==c2){
                         commonChars.append(c1);
 8
                         break;
 9
10
                 }
11
             int asciisum=0;
12
             for(int i=0;i<commonChars.length();i++){</pre>
13
                 asciisum+=commonChars.charAt(i);
14
15
16
             while(asciisum>=10){
                 int tempsum=0;
17
                 while(asciisum>0){
18
                     tempsum+=asciisum%10;
19
20
                     asciisum=asciisum/10;
21
22
                 asciisum=tempsum;
23
24
             return asciisum;
25
26
        public static void main(String[] args){
            char[] input1={'a','b','c'};
char[] input2={'b','c'};
27
28
29
             System.out.println(calculatesingledigitsum(input1,input2));
30
31 }
```

Input	Expected	Got
a b c b c	8	8

Question **3**

Correct

Marked out of 5.00

Flag question

You are provided with a string which has a sequence of 1's and 0's.

This sequence is the encoded version of a English word. You are supposed write a program to decode the provided string and find the original word.

Each alphabet is represented by a sequence of 0s.

This is as mentioned below:

Z:0

Y:00

X:000

W:0000

V:00000

U:000000

T:0000000

The sequence of 0's in the encoded form are separated by a single 1 which helps to distinguish between 2 letters.

Example 1:

input1: 010010001

The decoded string (original word) will be: ZYX

Example 2:

The decoded string (original word) will be: WIPRO

Note: The decoded string must always be in UPPER case.

For example:

Input	Result
010010001	ZYX
000010000000000000000010000000001000000	1 WIPRO

Answer: (penalty regime: 0 %)

```
10
             // Iterate over each part
11
             for (String part : parts) {
    // Skip empty parts (which could appear due to multiple consecutive '1's)
    if (!part.isEmpty()) {
12
13
14
                      int length = part.length();
15
16
                      // Calculate the letter corresponding to the length of 0's
17
                      // 'Z' corresponds to 1 zero, 'Y' to 2 zeros, ..., 'A' corresponds to 26 zer char letter = (char) ('Z' - (length - 1));
18
19
                      result.append(letter);
20
21
22
23
24
             return result.toString();
25
26
27
         public static void main(String[] args) {
28
             // Create scanner object to read input
29
             Scanner sc = new Scanner(System.in);
30
31
32
             String input = sc.nextLine();
33
34
             // Decode the string and output the result
35
             String decodedString = decodeString(input);
36
             System.out.println(decodedString);
37
38
             sc.close();
39
40
41
```

Input	Expected	Got
010010001	ZYX	ZYX
000010000000000000000010000000001000000	WIPRO	WIPRO
